Abstract

Milk is the secreted fluid of the mammary glands of female mammals. Since the initial times, mankind has used the milk of goats, sheep, and cows as food. Milk play an important part in human life as its calcium, protein and fat content and this is necessarily needed food for infant and children. milk is usually viewed as nutritious food with lots of vitamins, minerals, and fats, proteins etc with all these nutrients. sometime milk and its products contaminated by various substance via manure, drugs used in infectious state of cow, and insecticide. The aim of present study is to evaluate contents of milk products like milk, Cheese, Curd, Butter, Ghee and also to Analyse the presence of contaminants substance by qualitative and quantitative determination.

Keywords

Milk, Fats, Contents, Contaminants

1.INTRODUCTION:

Milk is composed of lactose and proteins, fats and minerals. In total composition around 31 % of fat present in milk which provide more energy. These fat content make milk in soft texture and creamy taste. The variety of milk products are consumed by humans like cream, butter, yogurt, ice cream, and cheese. Milk and milk products are rich in nutrients, contain high moisture and have neutral pH. Based on the above characteristics, milk easily help for growth and multiplication of many bacteria. Even pasteurized or refrigerated milk have tendency to contaminated with many bacteria. The various sources of these contamination from air, milking equipment, feeds, soils, faeces and housing will cause diseases like tuberculosis, brucellosis, lysteriosis, and different kinds of gastrointestinal disorders. moulds such as Aspergillus flavus and Aspergillus parasiticus have a capability to produce toxic substance aflatoxins which was introduced

through cattle feed. Aflatoxinsis a group of highly toxic secondary metabolic products Produced from these types of Fungai. Pesticide have a capability to produce health risk in human.

2.COMPOSITION OF MILK:

V. GANTNER et al, 2015 estimated milk and fat composition from different species and also discussed similarities and comparison to women milk with some milk species .As we know majority of milk contain carbohydrate (lactose), fat, protein, mineral its composition is varies based on different factors such as type of species, animals feed and the stage of lactation. In the same species also, it depends on genetics composition will varies.

3.POSSIBLE CONTAMINATION IN MILK:

Contamination of milk occurs from various sources which are:

A. Contamination due to External Factors:

a) On the Farm:

- After the milking process, the milk is contaminated by various environmental bacteria due to improper storage.
- Various environmental sources include soil, water or the manure used.
- Undesirable bacteria from these sources include lactic streptococci, coli form bacteria, micrococci, enterococci, which are found in the soil manure.

b) In Transit at the Manufacturing level:

- Various tanker trucks, transfer pipes, sampling utensils and vessel at the milk mart contaminate the milk.
- Unclean hands and arm of employees also is the major source of information as pathogen may be present.

B. Contamination from cow:

a) From the udder Interior:

- Many bacterial species are present in the udder of the cow, which may enter into the milking tracts of the cow.
- As it enters the teats, it contaminants the milk of the cow.
- In spite of aseptic milking 100 to 10,000/ml counts have been reported.

b) From the Exterior udder:

• The udder gets in contact with the soil, and the bacteria from soil contaminate the milk.

c)Coat of the milk:

- The coat of the cow being directly exposed to the environment can contaminate the milk.
- Bacillus species contribute to the ropiness of the milk.

• II. Quantitative analysis:

• Estimation of casein in different branded milk and given sample Id as A, B, C, D, E

• Procedure:

 100ml of milk was taken then it was treated with Dil. Acetic acid. The precipitation of protein was observed, this precipitate protein was filtered, and it was dried in the oven for 24hrs to remove any adhering moisture. Then the amount of casein was weighed, and its percentage was calculated.

• II. Quantitative analysis:

 Estimation of casein in different branded milk and given sample Id as A, B, C, D, E

• Procedure:

 100ml of milk was taken then it was treated with Dil. Acetic acid. The precipitation of protein was observed, this precipitate protein was filtered, and it was dried in the oven for 24hrs to remove any adhering moisture. Then the amount of casein was weighed, and its percentage was calculated.

Flow chart :2 Classification of various milk products:

Various milk products available in market

Flowchart:4 depicting usage of cheese

Cheese

01

- More than 2000 varities of cheese are available in the world .
- •It is rich in protein, fat, vitamins and essential amino acids.

02

- •ingredients such as milk, starter, and coagulants used in the cheese processing .
- •And it involving many chemical, biochemical, and microbiological process.

03

• And it is nutritionally important to the body it also helps in building blocks for strong muscles.

Flow chart-5 depicting formation and uses of curd

Curd

Curds areformed bycurdling. It is process in which a dairy products obtained from coagulating the milk

This can be prepared by adding any edible acidic substance such as lemon juice or vinegar.

Milk has been left to sour will also naturally produce curd.

Generally curd is a semisolid sourish food prepared from fermented food Curd can be eaten plain or with addition of salt/pepper/ friuts/ sugar. It has been designated as functional food, it improves stamina and immunity.

Flow chart-6 Depicting formation and uses of ghee

Ghee Ghee is a common Ghee is relatively high It also contains 12.7 grams ingredient in traditional in calories, containing of fat, and minimal amount Indian cooking. 112 calories per 1of protein, carbohydrates. table spoon. Ghee also contain 108 micrograms of vitamin Ghee contains And it also helped to significantly less water or increase carcinogen moisture, than butter detoxification. does. The ghee will stay Although it is technically a fresher for longer than dairy product just like use ghee to saute vegetables, butter, it is well suited milk,cream ice cream cook meat, chicken, or fish or for travelling to fry rice.

Figure:3 Result showing test for contaminants in milk and milk products:

CONCLUSION

In the present study the major contents of milk of protein and carbohydrate has been analysed by qualitative and quantitative method. Also, Various possible contaminants in milk and its products are Cane sugar, Starch, Cellulose, Urea, Ammonium compound, Sulphate, Glucose, Sodium chloride, Nitrates. This study proves that only milk contains traces of sulphate which was proved by qualitative analysis. This paper give knowledge to analyse milk and milk products by various test in laboratory level.

ACKNOWLEDGEMENT:
