ABSTRACT

In this study, a simple, sensitive and highly accurate ultraviolet spectrophotometric method has been developed and validated for determination of metoprolol succinate in bulk and pharmaceutical formulations. The method is based on the measurement of the absorbance of metoprolol succinate solution in distilled water and phosphate buffer pH 6.8 at 221 nm and 223nm respectively in the wavelength range of 200 - 400 nm. Beer's law was obeyed in the concentration range of 5-25 µg/ml. The slope, intercept and correlation coefficient were also calculated. Results of percentage recovery shows that the method was not affected by the presence of common excipients in tablets. The developed method was validated in terms of accuracy, precision, linearity, limit of detection, limit of quantification which proves suitability of proposed method for routine estimation of metoprolol succinate in bulk and pharmaceutical formulations.

KEY WORDS

Metoprolol succinate, Spectrophotometry, Estimation, Tablets.

INTRODUCTION

Metoprolol is cardio selective β₁ adrenergic receptor antagonist mainly used in hypertension, angina pectoris, cardiac arrhythmia, congestive heart failure and myocardial infarction.[1,2,3] Chemically Metoprolol is (RS)-1-(Isopropylamino)-3-[4-(2-methoxyethyl) phenoxy] propan-2-ol with molecular weight 652.81. Freely soluble in water and

elimination half life of 3-7 hrs [4]. Mode of action of metoprolol is by reducing agonistic effect of catecholamines on the heart (which is released during physical and mental stress). This means that the usual increase in heart rate, cardiac output, cardiac contractility and blood pressure, produced by the acute increase in catecholamines is reduced. [5]

The drug is quite sensitive, even small amount of drug doses giving significant blockade of B₁ adrenoreceptors [7, 8]. Thus the quantitative determination of drug would be important. Literature survey reveals that several spectrophotometric, LC, HPTLC, HPLC, RP-HPLC, LC-MS methods have reported for the estimation of metoprolol succinate in pure and tablet dosage form.[9] The scope of present investigation was to develop and validate UV spectrophotometric method for the quantification of metoprolol succinate in bulk and pharmaceutical formulation.

MATERIALS

Metoprolol succinate was obtained as a gift sample from Ipca laboratories Ltd Mumbai (India). All analytical grade chemicals and solvents were supplied by S.D. Fine Chemicals, Mumbai, India. Distilled water was used to prepare all solutions. Freshly prepared solutions were always employed.

Equipment

The UV-Visible Spectrophotometer (Jasco-V630) with data processing system was used. The sample solutions were recorded in 1cm quartz cells against solvent blank over the range 200-400nm. A Citizen electronic analytical balance was used for weighing the samples. An ultrasonicator bath (PCI Analytics Pvt. Ltd.) was used for sonication of the drug solution.

Preparation of stock solutions:

- 1] In distilled water: 1000 ppm of stock solution was prepared by dissolving 10 mg of metoprolol succinate in 10 ml of distilled water; wavelength was determined and found to be 221nm.
- 2] Phosphate buffer pH 6.8: 1000 ppm of stock solution was prepared by dissolving 10 mg of metoprolol succinate in 10 ml of phosphate buffer pH 6.8; wavelength was determined and found to be 223nm.

Stock solution was further diluted to obtain 5-30µg/ml with distilled water and pH6.8 buffer respectively. Standard solutions of Metoprolol succinate (10 microgram per ml) were scanned in 200-400 nm range to determine the maximum absorbance. The absorbance was measured at 221nm for distilled water and 223 nm for phosphate buffer pH6.8 buffer. The calibration curve was plotted in the

concentration range of 5-30 µg/ml of metoprolol succinate using distilled water and pH 6.8 buffer as blank respectively.

Validation of the proposed method [10, 11, 12]

The proposed method was validated according to the International Conference on Harmonization (ICH) guidelines.

Linearity (Calibration curve): the developed method validates as per ICH guidelines. The plot of absorbance versus concentration is shown in fig1 and fig 2 for distilled water and phosphate buffer pH 6.8. It can be seen that plots are linear in the concentration range of 5-25 µg/ml with correlation coefficients (r^2) of 0.995 and 0.992

Precision (repeatability): Intraday and interday precision was determined by measurement of the absorbance for three times on same day and on three different days. The relative standard deviation for replicates of sample solutions was less than 2 % which meet the acceptance criteria for established method.

Accuracy (recovery study): Recovery studies were carried out by adding a known quantity of pure drug to the preanalysed formulations and the proposed method was followed. From the amount of drug found, percentage recovery was calculated as per ICH guidelines.

Sensitivity: Sensitivity studies were carried out where limit of detection (LOD) and limit of quantification (LOQ) were determined using following equation.

$$\text{LOD} = 3.3 \sigma / S \quad \text{LOQ} = 10 \sigma / S$$

Where, σ = the standard deviation of the response.

S = slope of the calibration curve.

RESULTS AND DISCUSSION

The maximum absorption for metoprolol succinate in distilled water and phosphate buffer PH6.8 were observed at 221nm and 223 nm respectively. The high values of correlation coefficient in distilled water and phosphate buffer pH 6.8 indicate linearity for metoprolol succinate in both solvents. Beer's law was obeyed for distilled water and phosphate buffer pH6.8 in the range of 5-30 µg/ml the accuracy of method was determined by calculating mean percentage recovery and %relative error. The Percentage recovery ranges from 99.53 to 100.80 and % relative error was within 2% both solvents and are

presented in Table 4. Precision was calculated as repeatability, inter and intraday variations for metoprolol succinate, %RSD was found to be less than 1. The repeatability data are presented in Table 2 and Table 3. LOD was found to be 1.389 µg/ml for detection of metoprolol succinate in water and

0.1399 µg/ phosphate buffer 6.8. LOQ was found to be 4.2084 µg/ml in distilled water and 0.4240 µg/ml in phosphate buffer pH 6.8. The proposed methods were found to be simple, accurate, precise and rapid for the routine determination of Metoprolol succinate in bulk and combined dosage form.1

Table 1: Optical parameters for determination of Metoprolol succinate

Data	Results	
	Distilled water	Phosphate buffer pH 6.8
Wavelength (nm)	221	223
Slope	0.019	0.027
correlation coefficient	R ² = 0.995	R ² = 0.992
Intercept	0.015	0.009
LOD(mcg/ml)	1.389	0.1399
LOQ(mcg/ml)	4.2084	0.4240

CONCLUSION

Simple spectrophotometric method for determination of metoprolol succinate have been developed and validated as per ICH guidelines. The proposed method is found to be simple, rapid, sensitive, accurate and reproducible also can be used for the routine quality

control analysis of metoprolol succinate in bulk and pharmaceutical formulations.
